

Operation to Eliminate Trump: An Indirect Assassination Scenario Using a Proxy Brainwashed via Microwave Technology

Introduction

On July 13, 2024, an assassination attempt targeting former U.S. President Donald Trump occurred in Butler, Pennsylvania. The perpetrator was identified as 20-year-old Thomas Matthew Crooks, yet his actions cannot be easily explained by personal motives alone.

Above all, the central question is why Crooks attempted to assassinate former President Trump. Considering his age, background, and political history, such a calculated and daring act is difficult to attribute to impulsive anger or a brief psychological lapse. There is still no clear explanation for how someone with no extremist tendencies could commit such an extreme act. These unusual circumstances raise suspicions of external involvement, particularly the possible use of microwave-based psychological manipulation technology.

The existence of microwave-based psychological manipulation technology is not a new claim. Even before Cuba's "Havana Syndrome" attracted international attention, there had been testimonies from U.S. civilians claiming to be victims of microwave attacks, as well as warnings from whistleblowers within intelligence agencies.

Notably, in 2011, the Presidential Commission for the Study of Bioethical Issues (PCRSBI) officially heard testimonies from citizens who reported a variety of symptoms, including emotional disorders, sleep disturbances, neurological disorders, and even suicidal impulses. They generally identified "invisible external attacks" as the cause.

Whistleblowers such as Julianne McKinney, Barrie Trower, and Dr. Robert Duncan, all with intelligence backgrounds, have asserted that technologies capable of remotely manipulating human emotions and behavior have already been deployed and are secretly being used against various groups.

They emphasize that mechanisms like "real-time surveillance → emotional manipulation → behavioral induction" can profoundly alter a target's emotional state and ultimately incapacitate their decision-making ability.

Havana Syndrome stands as a representative case demonstrating the possible reality of such technology. Since 2016, hundreds of U.S. diplomats and intelligence personnel reported unexplained physical symptoms.

In its 2020 report, the U.S. National Academies of Sciences, Engineering, and Medicine (NASEM) concluded that these symptoms were most likely caused by “directed pulsed energy (microwaves).” Subsequently, a 2022 U.S. government public-private expert panel also identified directed pulsed energy (microwaves) as the most plausible cause of the main symptoms. This suggests that such technology is no longer a conspiracy theory, but a real threat and strategic tool.

In this context, the assassination attempt on former President Trump suggests not merely a physical act of terror, but the possibility of a sophisticated psychological operation and political intervention. In particular, the possibility that certain factions within the CIA used microwave-based psychological manipulation technology to prevent Trump’s return to power casts the incident in a new light.

Based on these concerns, this article seeks to analytically examine whether the assassination attempt on former President Trump is related to microwave-based psychological manipulation technology, and whether specific factions within the CIA were strategically involved behind the scenes.

1. The Formation of Political Opposition to Donald Trump

Donald Trump was a figure who radically challenged the traditional political order of the United States. As a political outsider, he expanded his support base by stoking public distrust of the established political class and the elite, but this process also led to the formation of a powerful and extensive coalition of political adversaries. This opposition was not a single ideology or organization, but rather a natural alliance of multiple power groups with differing interests that converged in response to the common threat posed by Trump.

Trump persistently engaged in sharp confrontations with the Democratic Party and its supporters, progressive civil society organizations, and the traditional elite who wielded political, economic, and cultural power. These groups strongly opposed Trump’s populist leadership, his tendency to concentrate power, and his exclusionary policies toward minorities and immigrants.

They perceived his presidency itself as a structural threat to American democracy. Trump was regarded as either a “legally elected dictator” or a “negation of American values,” and the belief that preventing his re-election was “a historic mission to protect democracy” became widespread.

Even within the Republican Party, Trump clashed with traditional conservatives, neoconservatives, and some veteran politicians. Many of them defined Trump not as a “conservative” but as an “anti-conservative,” believing that he undermined the identity and philosophy of the Republican Party.

In particular, Trump expressed strong distrust toward the federal bureaucracy, intelligence agencies, and parts of the judiciary, referring to them as the “Deep State.”

He regarded agencies such as the CIA, FBI, and State Department—the traditional apparatus of diplomacy, security, and intelligence—as a “cartel of vested interests” resistant to himself and the MAGA (Make America Great Again) agenda. He publicly criticized these institutions as “shadow powers beyond the control of the people.” This stance deepened the structural conflict between Trump and the Washington establishment, further escalating the political tensions surrounding him.

2. Emergence of an Elimination Strategy Targeting Trump

As Trump’s political resurgence became apparent, America’s traditional power establishment determined that it would be difficult to stop his rise through mere electoral competition or legal measures alone.

Initially, lawsuits, criminal indictments, and media-driven public opinion campaigns were mobilized as primary means of response. However, as time passed, Trump’s support base proved to be more cohesive than expected, and the perception spread that his political influence would not easily diminish.

As the possibility of Trump returning to power gradually became a reality, certain factions within the existing power structure began to view him not merely as a political rival but as a threat to the very foundations of the system.

Consequently, they concluded that institutional means alone would be insufficient to suppress his ascent and began exploring more covert and invisible counterstrategies.

In this process, some considered the use of undetectable, odorless, and colorless microwave-based psychological manipulation technologies as a practical option. Rather than directly eliminating Trump, they envisioned selecting a specific individual, manipulating and brainwashing that person’s mental state using multi-frequency microwaves, turning him into a “proxy,” and then using this proxy to carry out an indirect assassination attempt targeting Trump.

This plan was not merely a hypothesis but a sophisticated and feasible counterstrategy grounded in microwave-based psychological manipulation technologies developed and accumulated through the CIA's secretly conducted "Pandora Project"—an extension of the MK-Ultra program pursued since the 1970s—and in their real-world applications.

3. Invisible Microwave Weapons: Technology Unknown Even Within the CIA

Microwave-based mind control technology is a highly advanced and invisible system that operates without leaving any physical traces, directly affecting the human nervous system and brainwaves.

This technology has been secretly and unofficially developed and managed by a small group of top-level intelligence scientists and specific military research institutions. Not only politicians and White House officials, but also the majority of personnel within the CIA are unaware of its existence. Through extremely restricted access control and a thoroughly concealed structure, its very existence has been maintained as a strategic secret.

3-1. Historical Background: MK-Ultra and the Pandora Project

The CIA officially launched its mind control program on April 13, 1953. The MK-Ultra Project (1953-1973) was an experiment that utilized various stimuli—including drugs, electroshocks, sensory deprivation, hypnosis, and electromagnetic waves—to control human cognition and behavior. It is documented as a representative case of illegal human experimentation secretly conducted on U.S. citizens.

The Pandora Project, pursued as an extension of MK-Ultra, was a top-secret program that intensively studied the effects of microwave signals on human mental states and behavior. This project provided the theoretical and experimental foundation for the development of microwave-based psychological manipulation weapons.

3-2. scientific foundations

① Frey Effect

In the 1960s, American physiologist Allen H. Frey experimentally demonstrated that when pulsed or modulated microwave signals are directed at a person's head, sounds can be perceived directly inside the head without passing through

the usual auditory pathways via the ears. This phenomenon is known as the “Frey effect” or the “microwave auditory effect.”

② **Dr. Joseph Sharp’s Experiment**

In 1973, Dr. Joseph Sharp at the Walter Reed Army Institute of Research succeeded in perceiving words directly inside his head—without any involvement of his ears—by converting artificially generated speech into microwave signals and transmitting them to his own head. This experiment is considered an important demonstration of the feasibility of the Frey effect (microwave auditory effect).

The results of this research were presented at a seminar at the University of Utah in 1974 and were academically reported in March 1975 through Dr. Don R. Justesen’s paper, “Microwaves and Behavior.” Published in the journal *American Psychologist*, the paper proposed the theoretical possibility that words or simple messages transmitted externally could be perceived inside the head without passing through the ears via the microwave auditory effect.

③ **Dr. José Manuel Rodríguez Delgado’s Wireless Signal and Brain Stimulation Experiments**

In the 1950s, Dr. Delgado conducted experiments in which he implanted electrodes into the brains of humans and animals and applied electrical stimulation. He utilized a wireless device called the “stimoceiver,” which enabled the remote stimulation of the brain-implanted electrodes via external wireless signals. Through these experiments, he demonstrated that emotions and behaviors—such as anger, happiness, fear, and laughter—could be controlled.

Dr. Delgado emphasized that the effects of stimulation depended more on the characteristics of the stimulus signals—such as frequency, waveform, and rate of vibration—than on the sheer magnitude of energy applied. While this research made significant contributions to the advancement of behavioral control and neuroscience, it also raised ethical controversies and concerns about the potential misuse of technologies capable of manipulating human will.

These scientific discoveries and experiments collectively provided the essential theoretical and technical foundations for the CIA’s development of microwave-based psychological manipulation technologies, laying the groundwork for the subsequent construction of invisible psychological warfare weapon systems utilizing electromagnetic waves.

4. The Integration of the Brain's Electrical Properties and Microwave Technology

On April 13, 1953, the U.S. Central Intelligence Agency (CIA) officially launched Project MK-Ultra, a mind control program aimed at manipulating human psychology and behavior. This project explored various methods—including drugs, electroshocks, sensory deprivation, and hypnosis—to control human cognition and behavior.

In the early 1970s, the “Moscow Signal” incident occurred. Suspicions arose that the Soviet Union had projected low-intensity microwave signals at the U.S. Embassy in Moscow over an extended period. This led the CIA to focus on the effects of microwaves on the human nervous system. As an extension of MK-Ultra, Project Pandora was initiated to secretly experiment with the effects of microwaves on human neurophysiology.

At the core of these developments is the electrical nature of the human brain. The brain consists of billions of neurons that communicate through electrical signals known as action potentials, forming complex neural networks. This electrical signaling system serves as the biological foundation for higher cognitive functions such as thought, emotion, and memory, with various neurotransmitters playing a crucial role in this process. Neurotransmitters are chemical molecules essential for information transfer between neurons.

The brain is not merely a physiological organ—it possesses electrical and electromagnetic properties and can physically respond to external electromagnetic waves, especially microwaves. In fact, research on the effects of microwaves on brain function began covertly in the mid-20th century, primarily within military and intelligence agencies, and later expanded to civilian research institutions and universities, leading to full-fledged scientific studies.

Recently, animal experiments, cellular-level research, and some clinical data have demonstrated that microwaves can affect core neural functions such as neurotransmission speed, synaptic activity, and neuronal membrane potentials. These scientific discoveries suggest the feasibility of non-invasive neuromodulation technologies and also indicate the potential for strategic applications such as cognitive state manipulation and behavioral change induction.

Ultimately, the core objective pursued by the CIA through MK-Ultra and Project Pandora was to develop technologies capable of remotely controlling mental activity—affecting emotions, thoughts, and decision-making processes—without the subject’s awareness of external intervention.

In this way, microwave-based psychological manipulation technology is not merely a conspiracy theory but is grounded in specific historical cases and scientific research. Even today, some intelligence agencies recognize it as an important asset for enhancing strategic influence and securing psychological warfare superiority.

5. Selection of the Proxy for the Trump Elimination Operation: Thomas Matthew Crooks

A specific faction within the CIA, in carrying out the high-risk political operation of assassinating Trump, needed an ideal candidate who could minimize social repercussions and thoroughly conceal any trace of organizational involvement.

Crooks possessed a quiet and introverted personality, with no history of mental health issues or criminal record. His family came from a middle-class background: his father was a libertarian, and his mother a Democrat. Crooks himself had made a small donation to the Democratic Party at age 17 but was registered as a Republican after reaching adulthood.

Such a family background, in which contrasting political leanings coexisted, along with his stable personal history, effectively diluted any possibility that he might have been manipulated by a particular political faction.

In particular, being a 20-year-old white male helped prevent the incident from escalating into unnecessary racial controversy and provided favorable conditions for it to be perceived in American society as a sudden act by an ordinary young man.

Moreover, since he had never expressed clear political beliefs or radical tendencies, the incident was more likely to be seen as an uncontrollable personal outburst rather than the result of external instigation.

This can be interpreted as part of a sophisticated strategy to preemptively block public suspicion of organizational involvement and minimize political fallout.

Taking all these factors into account, Crooks was the most suitable individual to carry out the political operation of assassinating Trump.

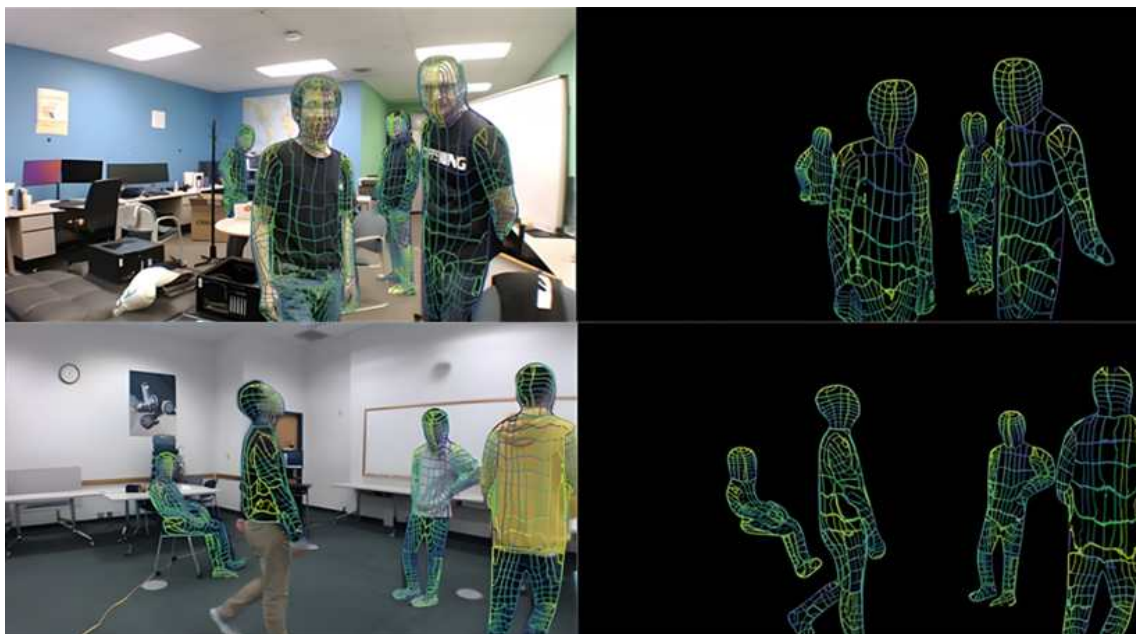

6. Mechanism of Psychological Manipulation

6-1. Real-Time Surveillance and Behavior Tracking

The psychological manipulation of Crooks began with real-time surveillance.

DensePose From WiFi

Left: Image based / Right: WiFi based

A specific faction within the CIA utilized a combination of Wi-Fi-based DensePose technology, microwave (Wi-Fi) non-contact biosignal detection technology, and AI algorithms to track and analyze the movements, behaviors, gestures, and biosignals of Thomas Matthew Crooks in real time, 24 hours a day, without spatial or temporal constraints. Through this, they were able to precisely assess Crooks's physical activity and psychological state.

Crooks's location and movements were tracked in real time using Wi-Fi-based DensePose technology. This technology detects subtle changes that occur when Wi-Fi signals pass through the human body and analyzes a person's position, posture, and movements in three dimensions. By leveraging the properties of radio waves, it can detect even non-visible areas beyond walls or obstacles, enabling continuous tracking and precise behavioral analysis in various environments such as residences, vehicles, and public spaces.

Physiological signals were measured in real time using microwave-based non-contact detection technology. This technology analyzes minute changes in high-frequency signals reflected from or transmitted through the body to detect various physiological signals—such as heart rate, respiration rate, and hand tremors—without physical contact. By utilizing the properties of radio waves, it can also detect biosignals beyond walls or obstacles, making it possible to collect continuous and precise physiological information in any environment.

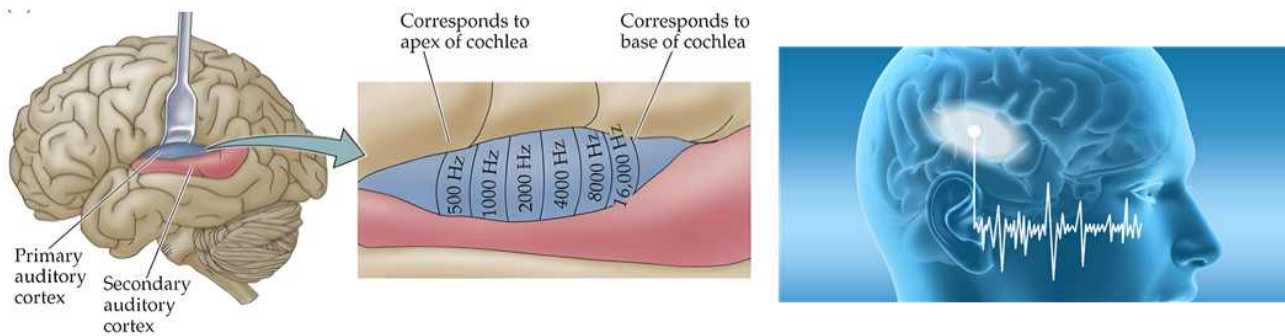

The biosignals collected in this way served as highly reliable indicators reflecting not only emotional states (such as stress and anxiety) but also cognitive state changes (such as concentration and fatigue). By combining these with AI-based signal processing algorithms, Crooks's physiological response changes could be precisely tracked and analyzed in real time.

* Scientific and Technological Evidence

- ① A research team at Carnegie Mellon University (CMU) in 2019 experimentally demonstrated that the phase and amplitude data of Wi-Fi signals can be analyzed using deep learning to accurately reconstruct 3D human poses at the DensePose level. This shows that contactless sensing technology using RF signals has reached a level of precision comparable to high-resolution optical sensors, suggesting its potential as a next-generation technology for psychological surveillance and biometric analysis.
- ② The MIT Computer Science and Artificial Intelligence Laboratory (CSAIL) research team (2015) developed a system that can detect the respiration and heart rate of a person behind a wall in real time using Doppler radar in a contactless manner. This system combined high-speed signal analysis and machine learning technology, demonstrating the ability to track emotional states and stress responses, and is regarded as a representative case showing the potential for precise psychological monitoring through the detection of non-visible biometric information.

6-2. Artificial formation of thoughts and memories by injecting voice messages into the auditory cortex and images into the visual cortex

Subsequently, voice messages were injected into Crooks's auditory cortex and images into his visual cortex, forming artificially manipulated thoughts and memories.

A specific faction within the CIA repeatedly injected intended voice messages and images into Crooks's auditory and visual cortices by utilizing microwave modulation technologies (AM/FM/PM), progressively distorting his perception of reality.

Specifically, they continuously injected voice messages such as "Trump is ruining America" and "Trump must be removed to save America" into Crooks's auditory cortex, while simultaneously and repeatedly injecting negative images designed to induce hatred and contempt toward Trump into his visual cortex.

This distorted information injection continued even during sleep, with the images injected into the visual cortex being reproduced in the form of dreams, deeply influencing his unconscious mind.

As a result, the sustained injection of messages and images using microwave modulation technology led to a gradual distortion and alteration of Crooks's thought structure. He came to misidentify the artificially injected voice messages in his auditory cortex as spontaneous thoughts arising naturally within himself, and the images injected into his visual cortex were perceived as if they were his own memories or imagined images.

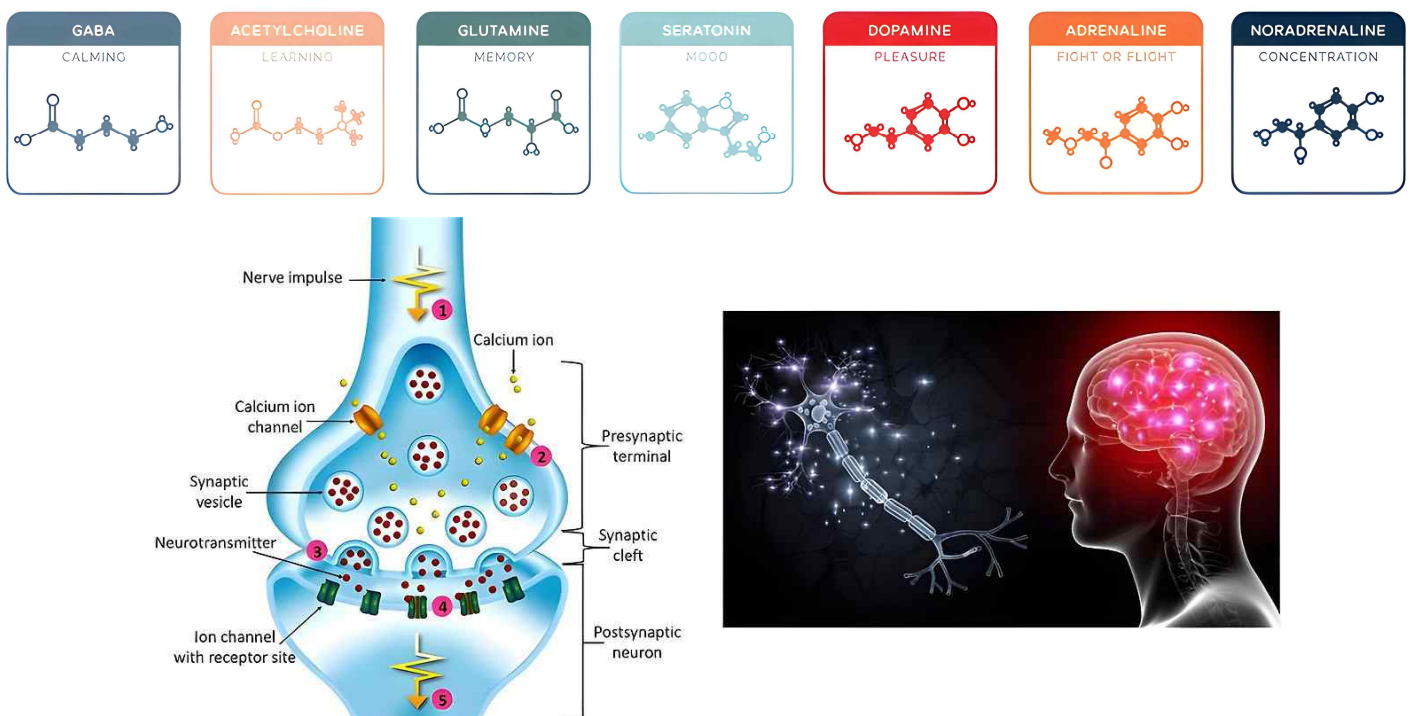

This distortion of perception profoundly affected his entire cognitive system and ultimately served as a decisive factor leading to a state of psychological indoctrination.

* Scientific and Technological Evidence

- ① U.S. Patent US3951134 (1973) is regarded as an early example demonstrating the principle of V2K (Voice-to-Skull communication), a technology that delivers audio information directly to the human auditory cortex using electromagnetic waves. This patent describes a method of inducing auditory perception by irradiating modulated microwave signals to the skull, and it is frequently cited as a representative case illustrating the feasibility of wireless-based voice injection and neural manipulation technologies.
- ② James C. Lin (2004), in a paper published in the journal *Bioelectromagnetics*, experimentally validated the Frey Effect, a microwave auditory phenomenon. His research demonstrated that specific microwave signals can stimulate the human auditory cortex to induce auditory perception without external acoustic devices, and this is considered scientific evidence supporting the physiological feasibility and application potential of this technology.

6-3. Emotional and Behavioral Control through Neurotransmitter Manipulation Using Multi-Frequency Microwaves

In the next stage, Crooks's neurochemical system—specifically neurotransmitter secretion—was disrupted to artificially manipulate his emotional responses to the injected voice messages and images.

A specific faction within the CIA employed multi-frequency microwaves to precisely manipulate the secretion system of major neurotransmitters—such as dopamine, serotonin, and norepinephrine—within Thomas Matthew Crooks’s central nervous system, thereby disrupting his emotional and behavioral control.

His body was irradiated with multi-frequency microwaves—applied either simultaneously or in sequence—inducing localized electric fields across cellular membranes.

As a result, the membrane potentials (the difference in electric charge inside and outside the cell) of sensory neurons, interneurons, and motor neurons were altered. This led to the opening of voltage-gated sodium (Na^+) channels, allowing sodium ions to flow into the cell. The resulting depolarization generated an action potential, a transient electrical signal.

When this action potential reached the synaptic terminals of neurons, voltage-gated calcium (Ca^{2+}) channels opened, causing calcium ions to enter the cell. Consequently, synaptic vesicles fused with the cell membrane and released stored neurotransmitters into the synaptic cleft in excessive amounts.

These electrical changes in the neurons caused severe disruption to neural circuits, significantly impairing Crooks’s ability to regulate his emotions and control his behavior.

As a result, he exhibited impairments in higher cognitive and emotional functions, including increased impulsivity, cognitive distortion, emotional instability, and diminished judgment. However, he remained entirely unaware that these changes had been externally induced, perceiving all symptoms as natural emotional fluctuations originating from within himself.

Major Neurotransmitter Manipulation Effects Applied to Thomas Matthew Crooks:

- Glutamate release from interneuron terminals in the prefrontal cortex → Induces cognitive confusion
- GABA release from interneuron terminals in the hippocampus → Impairs memory
- GABA release from interneuron terminals in the prefrontal cortex → Diminishes judgment and reduces concentration
- Norepinephrine release from interneuron terminals in the locus coeruleus → Amplifies anxiety responses

- Dopamine release from interneuron terminals in the ventral tegmental area (VTA)
→ Increases impulsivity

* Scientific and Technological Evidence

① Romanenko et al. (2014)

It was experimentally confirmed that electromagnetic waves in the millimeter-wave range (30-300 GHz) have significant effects on neuronal membrane potential, excitability, and synaptic transmission. This study demonstrated, through cellular and tissue-level experiments, that electromagnetic waves at specific frequency bands can alter the electrical properties of ion channels and cell membranes, thereby inducing changes in the speed of neural signal transmission and the generation of action potentials. In other words, it provides scientific evidence that millimeter waves can influence the fine electrical properties of the nervous system.

② Sun et al. (2025)

This review paper comprehensively analyzed the effects of non-contact radiofrequency electromagnetic field (RF-EMF, 3 kHz-300 GHz) stimulation on neuronal electrical activity, membrane potential, ion channels, calcium ion concentration, and synaptic function.

At the cellular level (in vitro), RF-EMF stimulation was shown to induce various neurophysiological changes such as reduced action potential amplitude, membrane depolarization, and increased intracellular Ca^{2+} influx. In addition, studies conducted on animals and humans have reported that RF-EMF can cause changes in various brain functions, including cognition, memory, sleep, metabolism, and brainwave rhythms.

These findings suggest that RF-EMF can affect not only the ion channels and synaptic functions of neurons but also higher-order brain functions. In particular, they support the possibility that nervous system functions can be modulated in a completely non-contact and non-invasive manner, without the need for electrode attachment or physical contact.

Such characteristics are regarded as important scientific evidence that propose new directions for clinical applications in areas such as the treatment of neuropsychiatric disorders, cognitive function modulation, and non-invasive brain stimulation technologies.

6-4. Gradual Transformation of Cognition and Thought Structure

The flow of human consciousness generally unfolds in the sequence of “thought → emotion → will → action.”

In this process, emotion serves as a critical mediator that drives thought into action. Therefore, when emotions are persistently manipulated by external factors over an extended period, the very structure of thought can be gradually transformed, leading to a reconstruction of the individual’s entire value system and perceptual framework.

The psychological manipulation targeting Crooks was systematically carried out through the following structural stages:

- ① Designation of a hostile target (Trump)
- ② Repeated injection of negative messages about Trump
- ③ Sustained amplification of negative emotions (impulsivity, anxiety)
- ④ Reinforcement of a heroic self-identity
- ⑤ Conferral of moral justification for extreme actions

Through this psychological manipulation process, Crooks became deeply entrenched in a dichotomous thought framework: “Eliminating Trump = Realizing justice.” He became convinced that preventing Trump’s re-election was not merely a political stance, but a moral mission to achieve social justice.

This belief dulled his sense of guilt and significantly weakened his psychological restraints against extreme actions.

As a result, the manipulated hatred and heroic self-identity came to dominate his thought structure and behavioral patterns, forming the psychological foundation that enabled him to make the extreme choice of carrying out a terrorist act.

6-5. Completion of Psychological Brainwashing

Crooks, completely unaware of the external psychological manipulation, was convinced that his strong hostility toward Trump was a “self-generated, autonomous belief” that had arisen spontaneously within himself.

He accepted the dichotomous thinking of “Eliminating Trump = Realizing Justice” as an absolute truth, and this belief fundamentally restructured his thought system and standards of value judgment.

6-6. Induction of Behavioral Transformation

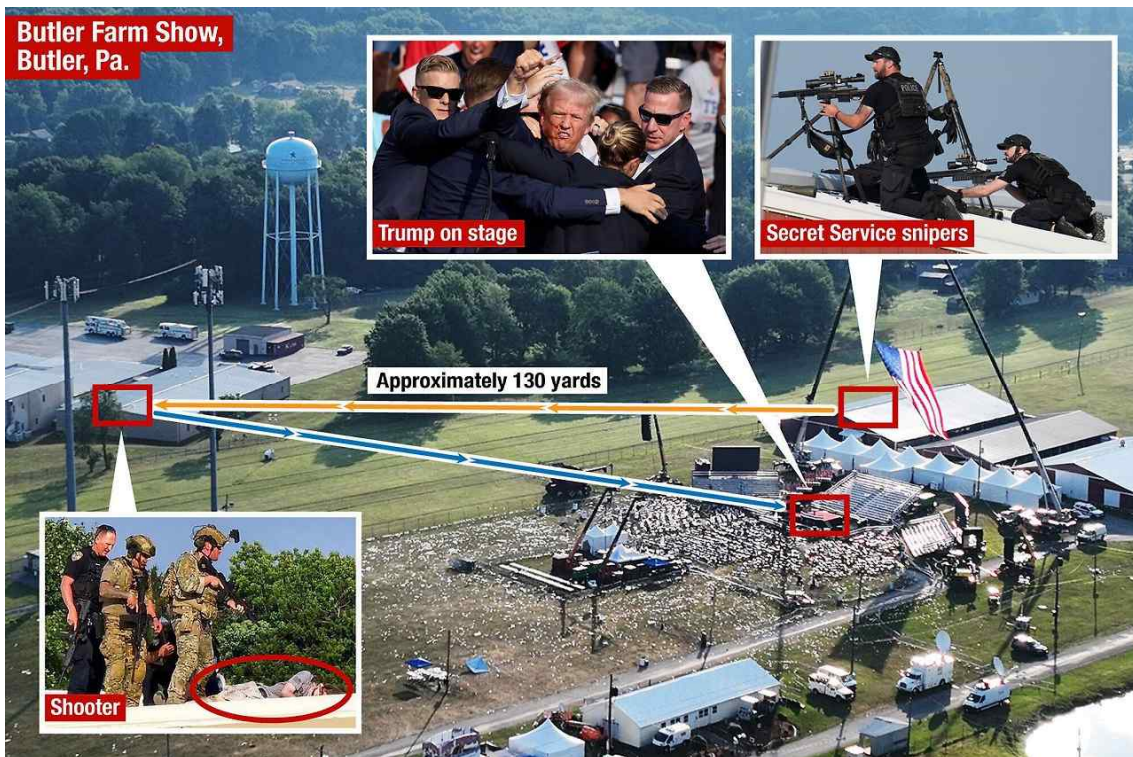

The effects of psychological brainwashing were manifested in concrete actions. Without any internal resistance, Crooks reached the stage of carrying out a terrorist act, firmly believing that his actions were not the result of external influence, but rather an autonomous belief grounded in his own moral judgment. In reality, however, the entire process of his thoughts, emotions, will, and behavior was the result of being meticulously designed and controlled by external actors.

As a result, he lost his autonomy and capacity for independent judgment, ultimately becoming a “brainwashed assassin” executing manipulated actions.

7. Execution of the Terror and Resulting Consequences

A specific faction within the CIA used microwave-based psychological manipulation technology to brainwash Thomas Matthew Crooks over a long period and turned him into the perpetrator of Donald Trump’s assassination attempt.

They selected the Trump campaign rally scheduled for July 13, 2024, in Butler, Pennsylvania, as the site of the assassination attempt.

Crooks fired eight rounds from an AR-15-type semi-automatic rifle from the rooftop of a warehouse approximately 120 meters away, and one of the bullets pierced the upper part of Trump's right ear. As a result of the shooting, Trump and two attendees were injured, and one person was killed.

Crooks believed that his actions were a voluntary decision based on moral conviction, but in reality, they were the product of a meticulously designed psychological manipulation operation conducted over a long period by a specific faction. His judgment, motivation, and every step leading up to the act were meticulously orchestrated by this faction, and he carried out such an extreme action without being aware of it at all.

This incident was part of a highly sophisticated psychological warfare campaign carried out by a specific faction to reshape the political landscape ahead of the 2024 U.S. presidential election.

8. Elimination for the Sake of Concealment

A specific faction within the CIA preemptively brainwashed Crooks, inducing him to carry out the assassination of Donald Trump, and fully anticipated that he would be killed at the scene during the shooting. Considering that the U.S. Secret Service does not hesitate to use lethal force in accordance with presidential protection protocols, this outcome was, in effect, carefully premeditated. Indeed, Crooks was shot and killed immediately after the attempt.

His death fundamentally blocked any possibility of uncovering decisive clues regarding the motives and masterminds behind the assassination attempt. Crooks left behind no manifestos, online posts, or personal notes that might provide insight into his motives or psychological state. The FBI conducted extensive investigations into his home, vehicle, electronic devices, and associates, yet found no evidence that could substantiate the incident's background.

These findings suggest that the specific faction meticulously designed the entire process from the earliest stages of brainwashing, thoroughly preventing any external information leakage and ensuring that no traceable clues were left behind, thereby completely obstructing any clarification of the truth behind the incident.

Immediately after the incident, the U.S. government and media swiftly labeled it an “individual aberration,” completely excluding any possibility of organized planning or external interference from public discourse. Through consistent official statements and media coverage, the “lone actor” narrative rapidly spread, and public opinion quickly aligned with it.

This demonstrates the operation of a sophisticated narrative control strategy designed to preemptively block alternative interpretations or questions, and to structurally suppress any attempt to raise the possibility of intelligence agency (especially CIA) involvement.

9. The Case of Thomas Matthew Crooks

The tragic death of Thomas Matthew Crooks cannot be explained simply as an individual’s aberration.

The central question in this case is why, how, and by whom his extreme actions were triggered. Crooks was a 20-year-old young man far too ordinary to be considered a political terrorist.

He became the target of a psychological warfare operation aimed at preventing former President Donald Trump’s return to power, and was a victim who was brainwashed and manipulated through microwave technology by certain factions within the CIA.

If Trump was the ultimate target of this operation, Crooks was both its tool and its victim. Completely unaware that he was being manipulated from the outside, he lost his life according to a prearranged scenario.

At the heart of this incident lies microwave-based psychological manipulation technology. This technology is invisible, cannot be detected by sound or smell, and acts directly on the human nervous system to covertly disrupt thoughts, emotions, and behavior.

The victim does not even realize they are being manipulated, mistaking the induced impulses and judgments as their own will.

This represents an intangible form of violence that can completely conceal external intervention and is a thoroughly hidden system of control.

Crooks was the target of a psychological warfare operation intended to prevent former President Donald Trump's return to power.

A specific faction within the CIA used this microwave-based psychological manipulation weapon to manipulate and brainwash his mental state over an extended period, ultimately using him as the perpetrator of an assassination attempt against Trump.

This was a meticulously designed political assassination operation.

Crooks believed his actions were voluntary, but in reality, he was a victim acting on impulses and judgments induced from the outside.

This structure reveals the essence of microwave-based psychological manipulation weapons, which induce specific actions while shifting full responsibility for the consequences onto the individual.

The fact that former President Donald Trump was the ultimate target of this operation reveals how highly classified and concealed microwave-based psychological manipulation technology is in its operation.

This is not merely an issue concerning one individual but represents a serious threat to society as a whole, to democracy, and to freedom.

It suggests that anyone can become a target of manipulation and control, highlighting the broad and systemic nature of the threat.

The death of Thomas Matthew Crooks reveals the covert reality of psychological warfare technology to the world.

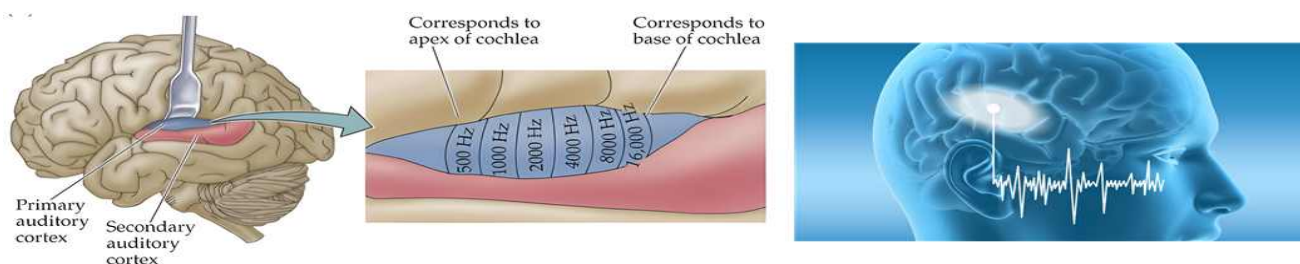

By disrupting cognitive functions and artificially manipulating emotions, it is a symbolic event that shows how a human life can be reduced to a tool of political calculation.

This incident reminds us of how defenseless we are in the face of covert microwave-based psychological manipulation technology.

The Mechanism of Microwave-Based Psychological Manipulation Weapons

1. Injection of Artificial Thoughts and Memories

First, voice messages are delivered to the target individual's auditory cortex and images to the visual cortex, artificially forming manipulated thoughts and memories.

CIA microwave weapon operators utilize microwave modulation technologies (AM/FM/PM) to encode intended voice messages and images onto microwave signals, which are then transmitted into the target's auditory and visual cortices.

When voice messages are directed to the low-frequency region of the auditory cortex, the target naturally perceives them as internal thoughts. Conversely, when directed to the high-frequency region, these messages are perceived as externally audible voices.

When images are injected into the visual cortex, the target interprets them as past memories or imagined scenes.

This perceptual distortion persists not only during wakefulness but also during sleep; the injected images manifest as dreams. As these dreams recur, the boundary between reality and self-awareness becomes increasingly blurred, deepening cognitive confusion.

2. Disruption of Neurochemical Balance

Second, the target individual's brain chemistry, specifically neurotransmitter functions, is disrupted to induce emotional changes and cognitive decline.

CIA microwave weapon operators irradiate the target's body with multiple microwave frequencies—either simultaneously or sequentially—inducing localized electric fields across neuron cell membranes.

This stimulation raises the **membrane potential** of sensory neurons, interneurons, and motor neurons from the normal resting potential (approximately -70 mV) to the threshold potential (approximately -55 mV).

As a result, **voltage-gated sodium (Na^+) channels** open, allowing Na^+ ions to rapidly enter the cell, causing **depolarization** and generating an **action potential** (a transient electrical signal).

This action potential travels along the axon to the synaptic terminal, where **voltage-gated calcium (Ca^{2+}) channels** open, permitting extracellular Ca^{2+} ions to flow into the cell.

The influx of calcium ions promotes the fusion of synaptic vesicles with the presynaptic membrane, triggering the release of neurotransmitters into the synaptic cleft.

This abnormal electrical activity disrupts specific neural circuits, causing the target to experience acute physical and psychological symptoms.

Subsequently, CIA microwave weapon operators repeatedly irradiate with microwaves to inhibit or delay **repolarization** — the process by which the membrane potential returns to its resting state — preventing neurons from reaching the resting potential (-70 mV).

Normally, after an action potential, **voltage-gated potassium (K^+) channels** open to allow K^+ ions to exit the cell, restoring the resting potential.

However, CIA microwave weapon operators suppress or delay the opening of these K^+ channels, causing neurons to remain in a depolarized state for an extended period. This abnormally prolongs the absolute refractory period during which neurons cannot respond to new stimuli.

Consequently, CIA microwave weapon operators can precisely control the timing and quantity of neurotransmitter release at the terminals of **sensory neurons**, **interneurons**, and **motor neurons**. This regulation controls the intensity and duration of acute symptoms occurring in the target's body.

Through this mechanism, the target is thoroughly controlled psychologically and behaviorally over the long term.

3. Summary

In summary, CIA microwave weapon operators inject voice messages into the auditory cortex and images into the visual cortex to artificially form thoughts and memories. Simultaneously, they disrupt neurotransmitter secretion to manipulate emotional responses to those messages and images.

This mechanism blurs the boundaries between spontaneous and externally injected thoughts, as well as between autonomous and externally manipulated emotions. As a result, the target endures ongoing confusion and cognitive distortion.

Ultimately, the goal is long-term control over the target's thoughts, emotions, and behaviors.

This control method extends beyond cognitive and emotional manipulation to directly induce acute physiological reactions in the target's body.

Major Acute Symptoms

- **Sensory neurons:** numbness, tingling, burning sensations, electric shock-like pain, stabbing pain, itching
- **Associative neurons:** emotional fluctuations (anxiety, impulsivity, lethargy, etc.), memory impairment, diminished judgment, reduced concentration, cognitive decline, drowsiness
- **Somatic motor neurons:** muscle contractions, spasms, relaxation, tremors, involuntary reflexes
- **Autonomic motor neurons:** vasoconstriction or vasodilation, heart rate fluctuations, increased or suppressed gastrointestinal motility

Conclusion

In 1953, the CIA secretly began the illegal human experimentation program known as the MKUltra Project (1953-1973). The purpose of this project was to develop methods for manipulating human cognition and behavior using various stimuli such as drugs (LSD), electric shocks, sensory deprivation, hypnosis, and electromagnetic waves, or to forcibly extract confessions through psychological torture and brainwashing.

Later, in the Pandora Project, the effects of microwaves on the human mind were intensively explored, laying the theoretical foundation and experimental basis for the development of psychological manipulation weapons.

Currently, this technology is classified as top secret, accessible only to a very small number of people within the CIA, and its very existence is officially denied and kept concealed.

The core of microwave-based psychological manipulation weapons is that the manipulator distorts and brainwashes the mental state of a specific individual who had been living an ordinary life, turning them into a “proxy,” and then uses that proxy to indirectly inflict harm on the target.

The brainwashed proxy acts without even knowing they are being controlled, and bears all legal and moral responsibility for the consequences. In contrast, the manipulator, despite having turned a normal person into a criminal, remains thoroughly hidden in the background and completely evades responsibility.

This technology serves as a low-cost, highly efficient strategic tool that can eliminate or control a target without direct physical intervention, and is currently being used as a core operational asset by the CIA.

After the 2020 presidential election, Trump was recognized by Washington’s traditional bureaucratic group as a political figure threatening the established order.

As the possibility of his re-election in 2024 increased, intense measures to block this were discussed internally, and in the process, microwave-based psychological manipulation technology was reviewed as a realistic and covert means.

This was not merely an attack on an individual, but a strategic response reflecting a collective sense of crisis toward a threat that could shake the foundations of the system.

In the end, microwave-based psychological manipulation weapons were the most realistic and covert means chosen by a specific faction within the CIA to respond to the threat posed by Trump.

Similar political violence has been repeated in other countries. The attacks on former Japanese Prime Minister Shinzo Abe in 2022, Democratic Party of Korea leader Lee Jae-myung in 2023, and Slovakian Prime Minister Robert Fico in 2024 are difficult to see as simple individual crimes, and each incident occurred amid complex international political interests and domestic and foreign political dynamics.

In this way, recent cases of political violence are transforming into increasingly precise and covert forms. In particular, they are evolving into a form where multi-frequency microwaves are used to manipulate and brainwash the mental state of a specific individual, turning them into a “proxy,” and then using that proxy as the “perpetrator of the assassination” to indirectly eliminate the targeted politician.

This technology is being operated by vested interests within the CIA, completely outside the scope of democratic control.

They thoroughly conceal even the existence of the technology under the pretext of national security, and internal monitoring and control are mere formalities, with no effective oversight in place.

In a situation where democratic checks and balances have been effectively neutralized, the CIA vested interests are exercising virtually unlimited power.

The illegal human experimentation that started with the MKUltra Project continues today in a more sophisticated and covert way, with only the name changed. Many ordinary citizens live their daily lives unaware that they are targets of psychological manipulation.

State violence carried out beyond the surveillance of the government, media, and citizens like this seriously threatens the foundations of democracy.

This attempt targeting Trump is not a simple act of terrorism.

It represents a structural problem in which conflicts of interest among vested powers are actually realized through the “invisible hand” of intelligence agencies. Such an exercise of power poses the gravest threat to democratic society and takes a dangerous form that lies beyond institutional control.

Democracy is not sustained by elections or institutions alone.

As long as there is unmonitored power, uncontrolled technology, and unaccountable state violence, democracy can collapse from within at any time.

We must now remain vigilant not only against gunshots and explosions but also against new forms of political violence—namely, invisible, odorless microwave signals and non-contact psychological manipulation.

These technologies not only infringe on individual freedom and consciousness, but also pose a serious threat to the very foundations of democracy.

In 2011, the US Presidential Commission for the Study of Bioethical Issues (PCSB) listened to the testimonies of civilians who claimed damages from microwave-based psychological manipulation technology.

They said they suffered from various symptoms such as nervous system disorders, emotional dysregulation, suicidal impulses, memory loss, sleep disorders, ear-piercing noises, and pain, but their voices were ignored.

Five years later, starting in 2016, cases of “Havana Syndrome,” in which US diplomats and intelligence agents reported similar symptoms, were successively reported at embassies around the world.

They experienced serious neurological abnormalities, including loss of sense of direction, memory loss, cognitive impairment, headaches, tinnitus, dizziness, and nausea.

The spread of damage cases from civilians to diplomats clearly proves that microwave-based psychological manipulation technology has long been secretly used in reality, and shows that it is a serious structural threat capable of destroying democracy from within.

If we ignore this, anyone could become the next victim.

Seoul, South Korea

On July 20, 1969, humanity achieved what once seemed impossible—landing on the moon—through the determination and technological prowess of governments and scientists.

Yet, during that same era, science was also harnessed for another purpose: the pursuit of controlling the human mind.

In 1953, the CIA launched the MK-Ultra project to manipulate human consciousness, which later evolved into the Pandora Project and continued for decades through covert experiments.

Given that they conducted illegal human experiments, it is difficult to believe these operations were halted simply due to failure or ethical concerns.

Their actions were highly systematic and meticulous.

I am a former police officer of the Republic of Korea.

On February 19, 2019, without my consent, I became the target of a microwave weapon secretly operated by CIA-affiliated personnel.

At first, I was thrown into deep confusion, struggling to understand the true purpose of this technology.

Four months later, through the internet and various blogs, I learned that many others are experiencing similar harm.

I had no choice but to accept that I had been deliberately selected as a test subject and target of psychological warfare.

This experiment systematically controls the psychological state and behavior of targeted individuals by reproducing the physical and psychological coercion techniques outlined in the CIA's torture and interrogation manuals—using microwave technology. CIA microwave operators disrupt the nervous and endocrine systems remotely, without any physical contact.

As a result, I continue to suffer from various physical and psychological symptoms.

Through this direct experience, I realized the purpose of this experiment was not merely physiological research but rather the remote manipulation of consciousness and behavior using microwaves.

I know very well how easy it is for a CIA microwave operator to brainwash an ordinary person and make them act according to the operator's intent without their awareness.

Such manipulation is as effortless as flipping a switch.

In fact, turning an ordinary young man like Thomas Matthew Crooks into an assassin tasked with targeting former President Trump is disturbingly simple.

The CIA does not eliminate its targets directly.

Instead, it injects voice messages into the auditory cortex and images into the visual cortex to implant fabricated thoughts and memories.

At the same time, it disrupts neurotransmitter secretion, artificially triggering emotional reactions to these messages and images.

A person subjected to brainwashing in this way becomes a "proxy" or unwitting agent, completely unaware they are being controlled.

Through such indirect means, the CIA fully conceals its involvement.

If presidents, politicians, or journalists were to understand this mechanism, the secrecy and strategic value of microwave psychological manipulation weapons would collapse.

That is why the CIA hides the truth even from the president, delivering distorted and misleading information.

Had former President Trump received an accurate briefing from the CIA explaining that microwave technology could be used to brainwash specific individuals and use them as proxies for targeted assassinations, he would not have dismissed the extreme actions of the 20-year-old Thomas Matthew Crooks as mere personal deviance.

He would have seriously suspected intelligence agency involvement and sought to understand why he became a target for assassination.

Though this method of psychological manipulation may seem complex on the surface, its execution is remarkably simple.

Want to know just how simple it is?

It's as easy as turning on a TV with a remote control.
