Have you ever sat inside headphones?

The sonic chair provides a unique audio experience, allowing you to sit at the very centre of a sound system.

Whether you enjoy listening to symphony orchestras, rock concerts, or audio books – the integrated satellite speakers are precisely adapted to your ears.

The speakers are encased in a carefully crafted body that creates sufficient volume for powerful bass tones, while several body-focused sound generators, in the seat and the backrest, further augment the lower frequencies – creating the feeling of a live performance.

The open design ensures a resonance-receptive, well-balanced sound environment. The active and passive sound insulation creates an acoustic island.

Background noises will not disrupt the enjoyment of music or an audio book in the sonic chair, and what the listener chooses to hear is hardly audible beyond the chair.

© sonic chair sit inside sound

You sit at the very centre of the sound system – wherever you are.

Regardless of whether you are sitting in a hotel lobby, an airport lounge, a bookshop, or a music store, the sonic chair will provide both exceptional listening pleasure and unique ambience.

You can even connect your iPod or laptop and work without distraction, or listen to the latest CDs or audio books.

The sonic chair is also ideal for waiting areas and for presenting music, audio books, films and texts at trade fairs, exhibitions and museums.

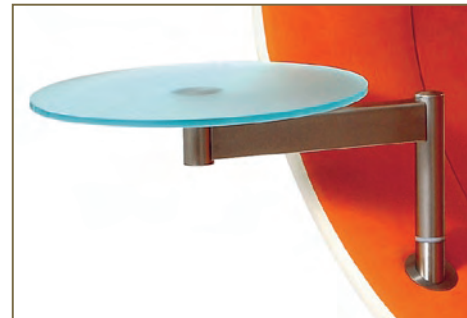

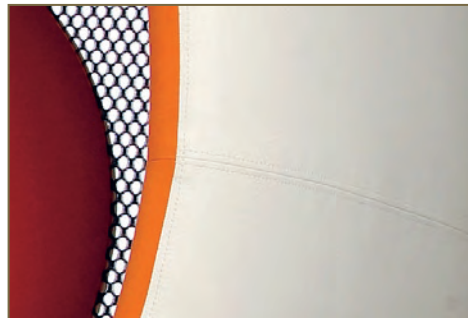

At home, it will finally enable you to listen to your favourite concert at full volume without disturbing your family, your roommates, or your neighbours.

To ensure first-class sound transmission at the centre of the sonic chair, perfectly matched components are integrated in a circular acoustic enclosure:

- specially developed four-channel amplifier in patented class D technology to allow separate regulation of both stereo channels, the subwoofer, and several body-focused sound generators
- equipped with high-quality loud speakers featuring separate tweeters and mid-woofers as well as a Scandinavian-made woofer from SEAS
- crossovers especially designed for the **sonic chair** in a 12 dB filter topology with high-end air-core coils and foil condensers
- support of the low frequency range from 16 to 40 Hz through silent physical vibration

Diverse input jacks for peripheral equipment
such as laptops, stereos, CD players, iPods or X-Boxes
