# TRIGONOMETRY LESSON ONE

## PART I TYPES OF ANGLES

**Memorize the following definitions:**

**Terminal arm:** The line representing where the angle is located in a plane. The terminal arm always comes out of the origin.

**Standard Angle:** The angle between the positive x-axis and the terminal arm, rotating counterclockwise.

**Principal angle:** An angle between  $0^\circ$  and  $360^\circ$ .

**Co-terminal angle:** An angle less than  $0^\circ$  or greater than  $360^\circ$  that shares the same position as a principal angle.

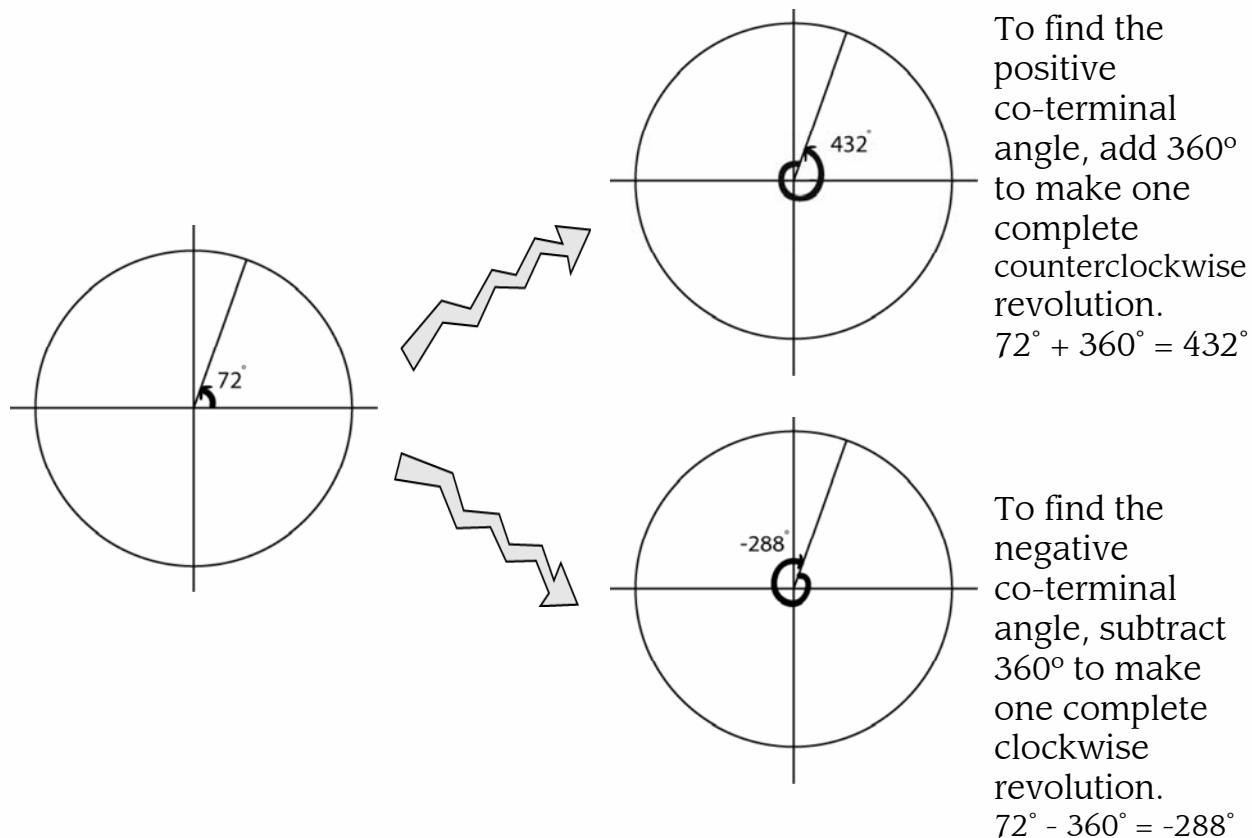

**Negative angle:** Angles obtained from rotating the terminal arm clockwise.

**Reference angle:** The angle between the terminal arm and the x-axis.

**General Solution:** A formula that gives all possible co-terminal angles.

**Example 1:** Find both a positive & negative co-terminal angle for  $72^\circ$ .

# TRIGONOMETRY LESSON ONE

## PART I TYPES OF ANGLES

**Example 2:** Given the co-terminal angle  $-992^\circ$ , find the principal angle.

We need to “unwind” our way back to between  $0^\circ$  and  $360^\circ$  by making revolutions of  $360^\circ$ .

The principal angle is  $88^\circ$

**Example 3:** Find the reference angle for  $620^\circ$ .

First find the principal angle.  $620^\circ - 360^\circ = 260^\circ$

Connect a line to the x-axis.

Now determine the angle inside the triangle.  
 $(260^\circ - 180^\circ = 80^\circ)$

The reference angle is  $80^\circ$

**Example 4:** Find the general solution for all co-terminal angles of  $101^\circ$ , and state the value of the 14<sup>th</sup> positive co-terminal angle.

The general solution must include all possible revolutions of  $360^\circ$ , so we use the formula:

$$\text{Principal Angle} \pm n(360^\circ)$$

For this question, it's  $101^\circ \pm n(360^\circ)$

When  $n = 1$ , we can either add  $360^\circ$  to get a positive co-terminal, or subtract  $360^\circ$  for a negative co-terminal.

When  $n = 2$ , we can either add  $720^\circ$  to get a positive co-terminal, or subtract  $720^\circ$  for a negative co-terminal.

The 14<sup>th</sup> positive co-terminal angle occurs when  $n = 14$ .

$$\begin{aligned} &101^\circ + 14(360^\circ) \\ &\text{*choose the plus since we want the positive angle.} \\ &= 101^\circ + 5040^\circ \\ &= 5141^\circ \end{aligned}$$

# TRIGONOMETRY LESSON ONE

## *Part I Types of Angles*

**1)** For each of the following principal angles, state a negative & positive co-terminal angle:

- a)  $47^\circ$
- b)  $102^\circ$
- c)  $321^\circ$
- d)  $225^\circ$

**2)** For each of the following co-terminal angles, find the principal angle:

- a)  $-1023^\circ$
- b)  $541^\circ$
- c)  $888^\circ$
- d)  $-361^\circ$

**3)** Find the reference angle for each of the following:

- a)  $992^\circ$
- b)  $-502^\circ$
- c)  $-1337^\circ$
- d)  $600^\circ$

**4)** Find the principal angle for each of the following reference angles:

- a)  $43^\circ$ , Quadrant III
- b)  $72^\circ$ , Quadrant IV
- c)  $89^\circ$ , Quadrant II
- d)  $1^\circ$ , Quadrant III

**5)** State the general solution for all co-terminal angles, and find the 10<sup>th</sup> positive angle for the following:

- a)  $52^\circ$
- b)  $131^\circ$
- c)  $300^\circ$

### Reference Angles Quickchart:

**Q1: Reference = Principal**

**Q2: Reference =  $180^\circ$  - Principal**

**Q3: Reference = Principal -  $180^\circ$**

**Q4: Reference =  $360^\circ$  - Principal**

### Answers

**1.**

- a)  $-313^\circ$  &  $407^\circ$
- b)  $-258^\circ$  &  $462^\circ$
- c)  $-39^\circ$  &  $681^\circ$
- d)  $-135^\circ$  &  $585^\circ$

**3.**

- a)  $88^\circ$
- b)  $38^\circ$
- c)  $77^\circ$
- d)  $60^\circ$

**2.**

- a)  $57^\circ$
- b)  $181^\circ$
- c)  $168^\circ$
- d)  $359^\circ$

**4.**

- a)  $223^\circ$
- b)  $288^\circ$
- c)  $91^\circ$
- d)  $181^\circ$

**5.**

- a)  $3652^\circ$
- b)  $3731^\circ$
- c)  $3900^\circ$

# TRIGONOMETRY LESSON ONE

## PART II ANGLE CONVERSIONS

*There are three different ways of expressing angles:*

**Degrees:** There are  $360^\circ$  in a circle.

**Radian Decimals:** 1 radian is equal to  $57.3^\circ$ . There are 6.28 radians in a circle.

**Radian Fraction:** Expressing radian values as a fraction involving  $\pi$ .  
There are  $2\pi$  radians in a circle.

*Throughout the unit, you will be working with all three types of angles.*

*The following examples show how to convert from one type to another.*

**Example 1:** Convert  $201^\circ$  to a radian decimal:

To convert from degrees  $\rightarrow$  radian decimals, multiply by the fraction  $\frac{\pi}{180^\circ}$

$$201^\circ \times \frac{\pi}{180^\circ} = 3.51 \text{ rad}$$

**Example 2:** Convert  $225^\circ$  to a radian fraction.

To convert from degrees  $\rightarrow$  radian fractions, multiply by the fraction  $\frac{\pi}{180^\circ}$

$$225^\circ \times \frac{\pi}{180^\circ} = \boxed{225^\circ} \times \frac{\pi}{180^\circ} = \frac{5\pi}{4}$$

↓

Divide these  
numbers in  
your TI-83, then  
Math  $\rightarrow$  Frac

### Remember These Conversions:

Radians  $\rightarrow$  Degrees: Multiply by  $\frac{180^\circ}{\pi}$

Degrees  $\rightarrow$  Radians: Multiply by  $\frac{\pi}{180^\circ}$

**Example 3:** Convert 3.24 radians to degrees:

To convert from radian decimal  $\rightarrow$  degrees, multiply by the fraction  $\frac{180^\circ}{\pi}$

$$3.24 \times \frac{180^\circ}{\pi} = 185.6^\circ$$

**Example 4:** Convert  $\frac{\pi}{4}$  radians to degrees:

To convert from radian fractions  $\rightarrow$  degrees, multiply by the fraction  $\frac{180^\circ}{\pi}$

$$\frac{\pi}{4} \times \frac{180^\circ}{\pi} = \frac{\cancel{\pi}}{4} \times \frac{180^\circ}{\cancel{\pi}} = 45^\circ$$

# TRIGONOMETRY LESSON ONE

## PART II ANGLE CONVERSIONS

**Example 5:** Convert  $\frac{7\pi}{6}$  radians to a radian decimal.

To convert from radian fraction  $\rightarrow$  radian decimal, simply type the fraction into your calculator:

$$7 \times \pi \div 6 = 3.67 \text{ rads}$$

**Example 6:** Convert 0.7854 radians to a radian fraction.

To convert from radian decimal  $\rightarrow$  radian fraction, first convert to degrees, then to a radian fraction.

$$0.7854 \times \frac{180^\circ}{\pi} = 45^\circ$$

$$45^\circ \times \frac{\pi}{180^\circ} = \boxed{45^\circ} \times \frac{\pi}{180^\circ} = \frac{\pi}{4}$$

Divide  $45^\circ$  by  $180^\circ$  and then  
math  $\rightarrow$  frac to get  $\frac{1}{4}$ .

# TRIGONOMETRY LESSON ONE

## PART II ANGLE CONVERSIONS

**1.** Convert the following from degrees → radian decimal:

- a)  $342^\circ$
- b)  $62^\circ$
- c)  $100^\circ$

**2.** Convert the following from degrees → radian fraction:

- a)  $300^\circ$
- b)  $60^\circ$
- c)  $150^\circ$

**3.** Convert the following from radian decimal → degrees:

- a) 0.02
- b) 2.51
- c) 1.33

**4.** Convert the following from radian fraction → degrees:

- a)  $\frac{2\pi}{3}$
- b)  $\frac{11\pi}{6}$
- c)  $\frac{3\pi}{2}$

**5.** Convert the following from radian fraction → radian decimal:

- a)  $\frac{5\pi}{4}$
- b)  $\frac{5\pi}{3}$
- c)  $\frac{\pi}{2}$

**6.** Convert the following from radian decimal → radian fraction:

- a) 2.6180
- b) 6.2832
- c) 5.2360

### Answers

**1.**

- a) 5.97
- b) 1.08
- c) 1.75

**2.**

- a)  $\frac{5\pi}{3}$
- b)  $\frac{\pi}{3}$
- c)  $\frac{5\pi}{6}$

**3.**

- a)  $1.15^\circ$
- b)  $143.8^\circ$
- c)  $76.2^\circ$

**4.**

- a)  $120^\circ$
- b)  $330^\circ$
- c)  $270^\circ$

**5.**

- a) 3.93
- b) 5.24
- c) 1.57

**6.**

- a)  $\frac{5\pi}{6}$
- b)  $2\pi$
- c)  $\frac{5\pi}{3}$

# TRIGONOMETRY LESSON ONE

## PART III Arc Length

*We can find the length of an arc by using the formula  $a = r\theta$*

$a$  = length of arc

$r$  = radius of circle

$\theta$  = angle of arc. (Radians ONLY)

**Example 1:** What is the length of arc if a radius of 4 m sweeps through  $185.6^\circ$  ?

First, convert the angle to a radian decimal.  $185.6^\circ \times \frac{\pi}{180^\circ} = 3.24$

Next, plug your numbers into the formula

$$a = r\theta$$

$$a = (4)(3.24)$$

$$a = 12.96 \text{ m}$$

**Example 2:** What is the angle in degrees if a radius of 2.3 m cuts an arc of 6.1 m ?

First solve for  $\theta$ :

$$\theta = \frac{a}{r}$$

$$\theta = \frac{6.1}{2.3}$$

$$\theta = 2.65$$

Now convert this radian decimal to degrees:  $2.65 \times \frac{180^\circ}{\pi} = 152^\circ$

**1) Find the arc length given the following information:**

a) radius = 10 m &  $\theta = 5.4$  radians

b) diameter = 16 m &  $\theta = 22^\circ$

**2) Find the radius given the following:**

a) arc length = 16 m &  $\theta = 123^\circ$

b) arc length = 23 m &  $\theta = \frac{5\pi}{4}$

**3) Find the angle (in degrees) given the following:**

a) arc length = 2 m & radius = 1 m

b) arc length = 5.2 m & radius = 3 m

### Answers

**1)**

a) 54 m

b) 3.07 m

**2)**

a) 7.45 m

b) 5.86 m

**3)**

a)  $114.6^\circ$

b)  $99.3^\circ$
